

No: 25 Define chemical equilibrium.

Soln:- Chemical equilibrium: The chemical equilibrium is the state of reversible reaction when the two opposing reactions occur at the same rate and the concentrations of the reactants and products do not change with time.

Let us consider the reaction, $A + B \rightleftharpoons C + D$

The equilibrium of the reaction can be attained from both sides. Thus the equilibrium concentrations of the reactants and products are the same and whether we start with A and B or C and D.

ता.वि.

Fig-TSA- At equilibrium the forward reaction rate equals the reverse reaction rate.

100/13

Q: No: 2: State and explain the laws of mass action. with example.

Soln:- Two Norwegian chemists, Gulberg and Waage, postulated a generalisation called the law of mass action. It states that,

"The rate of a chemical reaction is proportional to the active masses of the reactants."

By the term 'active mass' is meant the molar concentration. i.e. Number of moles per litre.

~~TARE~~ How can you use this law for deriving an expression for the equilibrium constant of reactions? 5

Mathematical expression of Law of mass action:

Let us consider a general reversible reaction

and let $[A], [B], [C], [D]$, represents the molar concentrations of A, B, C, D respectively at equilibrium point.

According to the law of mass action,

$$\text{Rate of forward reaction} \propto [A][B]$$

$$= k_1[A][B] \quad \dots \dots (1)$$

$$\text{Rate of reverse reaction} \propto [C][D]$$

$$= k_2[C][D] \quad \dots \dots (2)$$

where k_1 and k_2 are rate constants for forward and reverse reactions respectively

At equilibrium,

$$\text{Rate of forward reaction} = \text{Rate of back reverse reaction}$$

$$k_1[A][B] = k_2[C][D]$$

$$\Rightarrow \frac{k_1}{k_2} = \frac{[C][D]}{[A][B]}$$

$$\therefore K = \frac{[C][D]}{[A][B]}$$

we can write
 $* K_c = \frac{[C][D]}{[A][B]}$

any At specific temperature k_1/k_2 is constant since k_1 and k_2 are constants. The ratio k_1/k_2 is called equilibrium constant and represented by the symbol K.

This equation is known as the equilibrium law.

+ This subscript c indicates that the values are in terms of conc. of reactants and products.

Equilibrium constant expression for a reaction in general terms.

Let us consider the reaction,

$$\text{Then for the reaction, } K = \frac{[B][B]}{[A][A]} = \frac{[B]^2}{[A]^2}$$

for the general reaction,

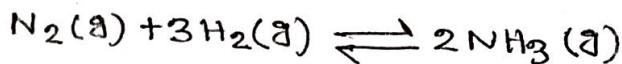

$$K = \frac{[L]^l \times [M]^m \times \dots}{[A]^a \times [B]^b \times \dots}$$

$$\therefore K_c = \frac{c_L^l \times c_M^m \times \dots}{c_A^a \times c_B^b \times \dots}$$

$$K_p = \frac{P_L^l \times P_M^m \times \dots}{P_A^a \times P_B^b \times \dots}$$

where the subscript C represent the molar concentration.

Example: Let us consider the reaction

The equilibrium constant for the reaction is

$$K = \frac{[NH_3]^2}{[N_2] \times [H_2]^3}$$

Q: No. 3: what is the equilibrium constant of a reaction, Define
and correlate K_p and K_c and K_e .

Soln:- Equilibrium constant: The equilibrium constant of reaction is (at equilibrium state of the reaction) the ratio of the product of the concentrations of the products to the product of the concentration of the reactants. OR, it is the ratio of forward and reverse rate constant at equilibrium point.

For a general reaction at equilibrium

Then state constant.

$$K = \frac{K_1}{K_2} = \frac{[L]^l \times [M]^m \times \dots}{[A]^a \times [B]^b \times \dots}$$

$$\text{or, } K_c = \frac{c_L^l \times c_M^m \times \dots}{c_A^a \times c_B^b \times \dots}$$

where, c represents the mole concentrations for the elements

K_P if the reactants and products of the reaction are in gaseous state. then c is represented by partial pressure constant for the above reaction

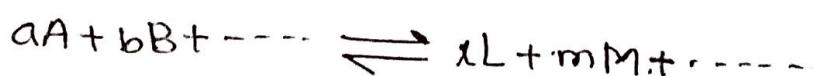

$$K_p = \frac{P_L^l \times P_M^m \times \dots}{P_A^a \times P_B^b \times \dots}$$

K_X if the reactants and the products of the reaction are represented by mole fraction then the equilibrium constant is represented by K_x

for the above reaction;

$$K_x = \frac{x_L^l \times x_M^m \times \dots}{x_A^a \times x_B^b \times \dots}$$

Relation between K_p , K_c and K_x : - Let us consider the general equation

The molar concentration rate constant

$$k_c = \frac{c_L^l \times c_M^m \times \dots}{c_A^a \times c_B^b \times \dots} \quad \dots \quad (1)$$

The partial pressure rate constant

$$k_p = \frac{P_L^l \times P_M^m \times \dots}{P_A^a \times P_B^b \times \dots} \quad \dots \quad (2)$$

The mole fraction rate constant

$$k_x = \frac{x_L^l \times x_M^m \times \dots}{x_A^a \times x_B^b \times \dots} \quad \dots \quad (3)$$

In an ideal gas mixture, if a gas having molar partial pressure P and if the gas occupy a volume V at temp T then

$$PV = nRT$$

$$\Rightarrow P = \frac{n}{V} RT$$

$$\therefore P = CRT \quad \left[\because c = \frac{n}{V} = \text{molar conc.} \right]$$

Substituting the value of P in equation (2) we get.

$$k_p = \frac{c_L^l \times (RT)^l \times c_M^m \times (RT)^m \times \dots}{c_A^a \times (RT)^a \times c_B^b \times (RT)^b \times \dots}$$

$$\Rightarrow k_p = \frac{c_L^l \times c_M^m \times \dots}{c_A^a \times c_B^b \times \dots} \times \frac{(RT)^{l+m+\dots}}{(RT)^{a+b+\dots}}$$

$$\Rightarrow k_p = k_c (RT)^{(l+m+\dots)-(a+b+\dots)}$$

$$\therefore k_p = k_c (RT)^{\Delta n} \quad \dots \quad (4)$$

where, $\Delta n = (l+m+\dots) - (a+b+\dots)$ = change in mole number of the reaction.

In a gas mixture the partial pressure of a gas is P , the total pressure is P . Then we can write $P=xP$, where, x = mole fraction.

Substituting the value of P in equation (2) we get

$$K_P = \frac{x_L^l P^l \times x_M^m P^m \times \dots}{x_A^a P^a \times x_B^b P^b \times \dots}$$

$$\Rightarrow K_P = \frac{x_L^l \times x_M^m \times \dots}{x_A^a \times x_B^b \times \dots} \times P(l+m+\dots) - (a+b+\dots)$$

$$K_P = K_x P^{\Delta n} \quad \boxed{5}$$

From (4) and (5) we can write

$$K_c (RT)^{\Delta n} = K_x P^{\Delta n}$$

$$\Rightarrow K_c = K_x \left(\frac{P}{RT} \right)^{\Delta n}$$

$$\Rightarrow K_c = K_x \left(\frac{1}{V} \right)^{\Delta n}$$

$$\therefore K_x = K_c V^{\Delta n} \quad \boxed{6}$$

Equation (4), (5) and (6) are the required relation between K_P , K_c and K_x .

Derive an equation showing the effect of temperature on equilibrium constant. os, 44,

Soln: There is appreciable change in the value of equilibrium constant with the change in temperature. It can be determined thermodynamically using the relation.

$$\Delta G^\circ = -RT \ln K_p \quad \text{--- (1)}$$

where ΔG° is the standard free energy of the reaction.

Differentiating equation (1) w.r.t T at constant pressure we get.

$$\frac{d}{dT}(\Delta G^\circ) = -R \ln K_p - RT \frac{d}{dT}(\ln K_p)$$

Multiplying both sides by $-T$ we get.

$$-T \frac{d}{dT}(\Delta G^\circ) = RT \ln K_p + RT^2 \frac{d}{dT}(\ln K_p)$$

$$\Rightarrow -T \frac{d}{dT}(\Delta G^\circ) = -\Delta G^\circ + RT^2 \frac{d}{dT}(\ln K_p)$$

$$\Rightarrow \Delta G^\circ - T \frac{d}{dT}(\Delta G^\circ) = RT^2 \frac{d}{dT}(\ln K_p) \quad \text{--- (2)}$$

Comparing equation (2) with Gibbs-Helmholtz equation

$$\Delta G^\circ = \Delta H^\circ + T \frac{d}{dT}(\Delta G^\circ) \text{ we get.}$$

$$\Delta H^\circ = RT^2 \frac{d}{dT} \ln K_p$$

$$\Rightarrow \frac{\Delta H^\circ}{RT^2} = \frac{d}{dT} \ln K_p \quad \text{--- (3)}$$

This equation is known as van't Hoff equation. where ΔH° is the enthalpy change of the reaction at constant pressure when all reactants and products are in their standard state. It has been found that the enthalpy change does not vary much with change in partial pressures of the reactants and products.

In this case, ΔH° may be replaced by ΔH . The equation (3) becomes

$$\frac{\Delta H}{RT^2} = \frac{d}{dT} (\ln K_p) \quad \text{--- (4)}$$

Integrating equation (4) within the limits K_{P_2} at temp T_2 and K_{P_1} at temperature T_1 :

$$\int_{K_{P_1}}^{K_{P_2}} d \ln K_p = \int_{T_1}^{T_2} \frac{\Delta H}{RT^2} dT$$

$$\Rightarrow \ln \frac{K_{P_2}}{K_{P_1}} = - \frac{\Delta H}{R} \left[\frac{1}{T_2} - \frac{1}{T_1} \right]$$

$$\Rightarrow \ln \frac{K_{P_2}}{K_{P_1}} = \frac{\Delta H}{R} \left[\frac{1}{T_1} - \frac{1}{T_2} \right]$$

$$\Rightarrow \ln \frac{K_{P_2}}{K_{P_1}} = \frac{\Delta H}{R} \left[\frac{T_2 - T_1}{T_1 T_2} \right]$$

$$\therefore \log \frac{K_{P_2}}{K_{P_1}} = \frac{\Delta H}{2.303R} \left[\frac{T_2 - T_1}{T_1 T_2} \right]$$

From this equation the heat of reaction can be determined if the values of equilibrium constant K_{P_2} and K_{P_1} at temperature T_2 and T_1 are known and vice-versa.

7. Deduce Van't Hoff equation in terms of K_c . Using this equation how can you proceed to determine ΔE for a reaction?

Soln:- We know that the equilibrium constant in terms of partial pressure (K_p) and in terms of concentration (K_c) are related to each other by the relation

$$K_p = K_c (RT)^{\Delta n}$$

taking logarithms we get.

$$\ln K_P = \ln K_C + \Delta n \ln RT$$

Differentiating w.r.t temperature get

$$\frac{d}{dT} (\ln K_P) = \frac{d}{dT} (\ln K_C) + \frac{\Delta n}{T}$$

$$\boxed{\Delta n \frac{1}{RT} R = \frac{\Delta n}{T}}$$

$$\Rightarrow \frac{d}{dT} (\ln K_C) = \frac{d}{dT} (\ln K_P) - \frac{\Delta n}{T} \quad \text{--- (1)}$$

$$\text{we know that } \frac{d}{dT} (\ln K_P) = \frac{\Delta H}{RT^2}$$

Substituting this into equation (1) we get.

$$\frac{d}{dT} (\ln K_C) = \frac{\Delta H}{RT^2} - \frac{\Delta n}{T}$$

$$\Rightarrow \frac{d}{dT} (\ln K_C) = \frac{\Delta H}{RT^2} - \frac{\Delta n RT}{TRT}$$

$$\Rightarrow \frac{d}{dT} (\ln K_C) = \frac{\Delta H - \Delta n RT}{RT^2}$$

$$\text{BUT we know } \Delta H = \Delta E + \Delta n RT$$

$$\therefore \frac{d}{dT} (\ln K_C) = \frac{\Delta E}{RT^2} \quad \text{--- (2)}$$

Equation (2) is the van't Hoff equation in terms of K_C

where ΔE is the heat of the reaction at constant volume.

Integrating (2) within the limits K_C_2 at temp. T_2 and K_C_1 at temperature T_1 we get.

$$\int_{K_C_1}^{K_C_2} d \ln K_C = \int_{T_1}^{T_2} \frac{\Delta E}{RT^2} dT$$

$$\Rightarrow \ln \frac{K_C_2}{K_C_1} = - \frac{\Delta E}{R} \left[\frac{1}{T_2} - \frac{1}{T_1} \right]$$

$$\Rightarrow \ln \frac{K_C_2}{K_C_1} = \frac{\Delta E}{R} \left[\frac{1}{T_2} - \frac{1}{T_1} \right]$$

$$\Rightarrow \ln \frac{K_C_2}{K_C_1} = \frac{\Delta E}{R} \left[\frac{T_2 - T_1}{T_1 T_2} \right]$$

$$\therefore \log \frac{K_C_2}{K_C_1} = \frac{\Delta E}{2.303 R} \left[\frac{T_2 - T_1}{T_1 T_2} \right]$$

From this equation the value of ΔE can be calculated if the values of equilibrium constant K_C_2 at T_2 and K_C_1 at T_1 are known.

~~Q8.~~ Write down van't Hoff equation for K_P and K_C and define the different terms involved in each case.

Sol:- van't Hoff equation for K_P is

$$\frac{d}{dT} (\ln K_P) = \frac{\Delta H}{RT^2}$$

where, K_P = Equilibrium constant in terms of partial pressure.

ΔH = Heat of the reaction at constant pressure.

T = Absolute temperature.

R = Gas constant.

van't Hoff equation for K_C is

$$\frac{d}{dT} (\ln K_C) = \frac{\Delta E}{RT^2}$$

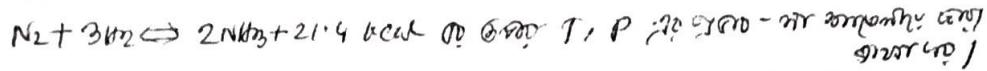

where, K_C = Equilibrium constant in terms of concentration

ΔE = Heat of the reaction at constant volume.

T = Absolute temperature.

R = Gas constant.

2006

TAREK

~~Ques.~~ state and explain Le Chatelier principle.

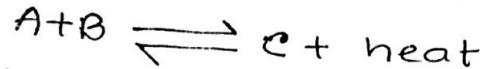

~~Ans.~~ - For chemical equilibrium Le Chatelier principle can be stated as:

If a change in concentration, pressure or temperature is caused to a chemical reaction in equilibrium, the equilibrium will shift to the right or to the left so as to minimize the change.

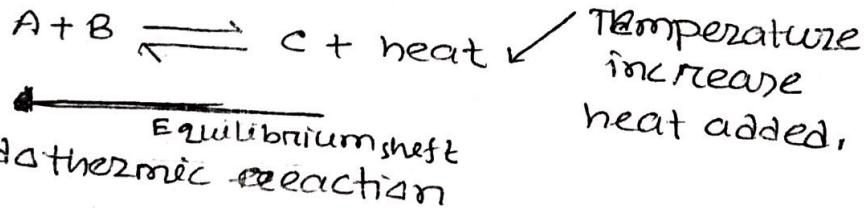

Now we proceed to illustrate the above statement by taking examples of each type of stress.

(1) Effect of change of temperature: When temperature of a reaction is increased, the equilibrium shifts in a direction in which heat is absorbed.

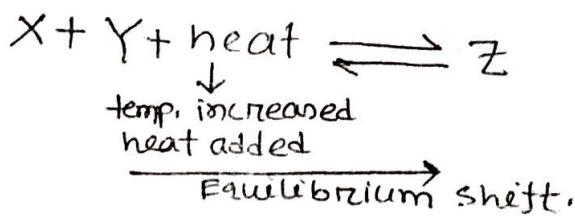

Let us consider an exothermic reaction.

When the temperature of the system is increased, heat is supplied to it from outside. According to this principle, the equilibrium will shift to the left which involves the absorption of heat.

The increase of temperature will shift the equilibrium to the right as it involves the absorption of heat.

TAREK

In general, we can say that the increase of temp. favours the reverse change in an exothermic reaction and the forward change in an endothermic reaction.

② Effect of change in pressure: If the pressure of a gaseous equilibrium state is increased, the equilibrium will shift in a direction which tends to decrease in pressure.

The pressure of a gaseous equilibrium state is determined by the total number of molecules it contains. If the forward reaction proceeds by the reduction of molecules, it will accompany by the decrease of the pressure of the system and vice-versa.

Let us consider an equilibrium reaction

The combination of A and B produces a reduction of number of molecules while the decomposition of C into A and B produces a increase in the number of molecules. Therefore the increase of pressure on the equilibrium will shift to the right and produce more C. A decrease of pressure will shift the equilibrium to the left when C will decompose to form more A and B.

moles decrease

Equilibrium shift
an increase of p

moles increases

Equilibrium shift on
decrease of p.

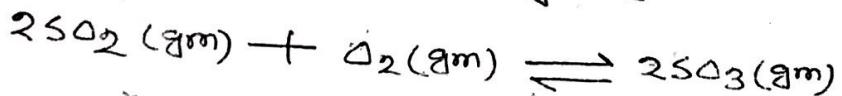

before we can conclude that the increase of pressure in a chemical equilibrium shifts it in a direction in which the number of moles decrease and vice-versa.

Effect of change in concentration:

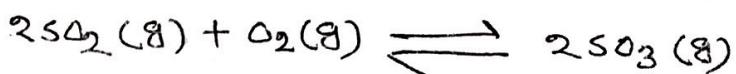

When the concentration of any of the reactants or products is changed the equilibrium shifts in a direction so as to minimize the change in concentration that was made.

KAREK

Q: N4: To derive an equation to show that the effect of pressure on the following equilibrium.

Soln: Given that the reaction is

At initial state. 2 1 0 mole

At equilibrium state. $2-2\alpha$ $1-\alpha$ 2α mole.

Let at initial state the mole numbers of SO_2 and O_2 are 2 and 1 respectively. At equilibrium, by reacting α mole of SO_2 and O_2 form SO_3 . The mole numbers of SO_2 , O_2 and SO_3 are $(2-2\alpha)$, $(1-\alpha)$ and 2α respectively.

At equilibrium, the total mole number

$$= 2 - 2\alpha + 1 - \alpha + 2\alpha$$

$$= 3 - \alpha$$

Let we consider the ^{total} pressure of the system $\Sigma = P$

We know that,

Partial pressure = Total pressure \times mole fraction.

$$\therefore P_{SO_2} = \frac{2-2\alpha}{3-\alpha} P$$

$$P_{O_2} = \frac{1-\alpha}{3-\alpha} P$$

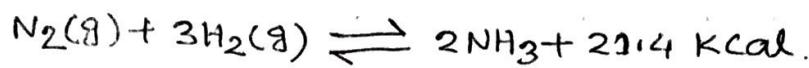

$$P_{SO_3} = \frac{2\alpha}{3-\alpha} P$$

$$\therefore K_p = \frac{(P_{SO_3})^2}{(P_{SO_2})^2 \times P_{O_2}} = \frac{\left(\frac{2\alpha}{3-\alpha}\right)^2 P^2}{\left(\frac{2-2\alpha}{3-\alpha}\right)^2 \times \left(\frac{1-\alpha}{3-\alpha}\right) P}$$

$$\therefore K_p = \frac{(3-\alpha)\alpha^2}{(1-\alpha)3P} \quad \text{--- (1)}$$

We can conclude from (1) if the pressure increases then the equilibrium constant K_p decreases. But at constant temp K_p is constant. So for keeping the value of K_p constant, the value of α must be increased if the pressure increases. So if the pressure increase the equilibrium will go forward and the ^{Production} of SO_3 will be increased.

No. 23; with the help of Le Chatelier's principle, explain the effect of temperature and pressure on the reaction

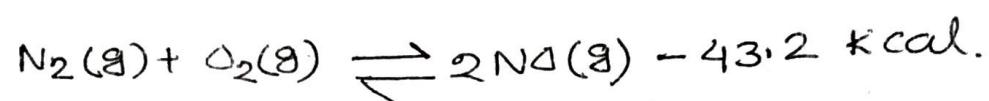

Soln:- The synthesis of ammonia from Hydrogen and Nitrogen is an exothermic reaction.

Effect of temperature:- When the temperature of the system is raised the equilibrium will shift from ~~left-to-right~~ ^{right-to-left}. On the other hand by lowering the temperature the equilibrium will shift from ~~right-to-left~~ ^{left-to-right}. which evolves the heat in an attempt to raise the temperature.

Effect of pressure:- Higher pressure on the reaction at equilibrium favours the shift of the reaction to the right. Because the forward reaction proceed a decrease in the number of moles.

Effect of concentration:- If the concentration of the elements of the reactants (i.e., H₂ and N₂) is increased the equilibrium will shift from right-to-left. and if the concentration of the element of product is increased the equilibrium will shift from right-to-left-to-right.

TAK
Q11: With the help of the Le Chatelier's principle explain the effect of temperature, pressure and concentration on the reaction.

Sol:- This is an endothermic reaction.

(i) Effect of temperature: when the temperature of the system is raised the equilibrium will shift from left-to-right and if the temperature of the system is lowered the equilibrium will shift from right-to-left.

(ii) Effect of Pressure: There is no effect of change in pressure on the equilibrium of the reaction because forward reaction involves no change in the number of moles.

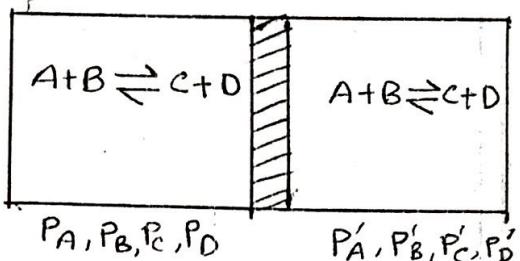

(iii) Effect of concentration: the formation of nitric-oxide is favoured by using the high concentration of the reactants i.e., N_2 and O_2 .

thermodynamic derivation of equilibrium constant.

Soln: Let us consider a reaction.

takes place at the same temp.
in two large container. Each
of the two container A,B,C,D
are in equilibrium state
and there is a semipermeable
membrane between the two c

Let the partial pressure of A, B, C, D in the 1st container is P_A , P_B , P_C , and P_D and that of the second container is P'_A , P'_B , P'_C , P'_D .

We know, $dG = Vdp - SdT$

$$dG = Vdp \quad [dT = 0, \text{ isothermal process}]$$

Now, free energy change of A, $\Delta G_{IA} = \int_{P_A}^{P_A'} v dP$

$$= \int_{P_A}^{P_A'} \frac{RT}{P} dP$$

$$= RT \ln \frac{P_A'}{P_A}$$

Free energy change of B, $\Delta G_B = RT \ln \frac{P_B}{P_{B_0}}$

$$" \quad " \quad " \quad " \quad c, \Delta G_{\text{fC}} = RT \ln \frac{P_c}{P'_c}$$

$$\text{D, } \Delta G_D = RT \ln \frac{P_p}{P_i}$$

Total free energy change

$$\Delta G_i = RT \ln \frac{P'_A}{P_A} + RT \ln \frac{P'_B}{P_B} + RT \ln \frac{P'_C}{P_C} + RT \ln \frac{P'_D}{P_D}$$

At equilibrium state, $\Delta G_i = 0$

$$RT \ln \frac{P'_A}{P_A} + RT \ln \frac{P'_B}{P_B} = RT \ln \frac{P'_C}{P_C} + RT \ln \frac{P'_D}{P_D}$$

$$\Rightarrow \ln \frac{P'_A}{P_A} + \ln \frac{P'_B}{P_B} = \ln \frac{P'_C}{P_C} + \ln \frac{P'_D}{P_D}$$

$$\Rightarrow \ln \frac{P'_A \times P'_B}{P_A \times P_B} = \ln \frac{P'_C \times P'_D}{P_C \times P_D}$$

$$\therefore \frac{P'_C \times P'_D}{P_A \times P_B} = \frac{P'_C \times P'_D}{P'_A \times P'_B} = K_P$$

[For this system the partial pressure is proportional to molar concentration]

$$\therefore \frac{c_C \times c_D}{c_A \times c_B} = K_C$$

Q: No. 5: (निम्नलिखित अवश्यकताएँ)

Soln: Let us consider the reaction.

where, a, b, c, d are the mole numbers of A, B, C, D respectively.

Let the partial pressure of a mole A, b mole B, c mole C, d mole D are P_A, P_B, P_C, P_D respectively.

$$\text{Free energy of a mole A} = \alpha G_A^\circ = \alpha [G_A^\circ + RT \ln P_A]$$

$$\text{.. b B} = b G_B^\circ = b [G_B^\circ + RT \ln P_B]$$

$$\text{.. c C} = c G_C^\circ = c [G_C^\circ + RT \ln P_C]$$

$$\text{.. d D} = d G_D^\circ = d [G_D^\circ + RT \ln P_D]$$

where, $G_A^\circ, G_B^\circ, G_C^\circ, G_D^\circ$ are the standard free energy of A, B, C, D respectively.

The free energy change of the reaction.

$$\Delta G = G_{\text{Product}} - G_{\text{Reactant}}$$

$$= (c G_C^\circ + d G_D^\circ) - (a G_A^\circ + b G_B^\circ)$$

$$= (c G_C^\circ + c RT \ln P_C + d G_D^\circ + d RT \ln P_D)$$

$$- (a G_A^\circ + a RT \ln P_A + b G_B^\circ + b RT \ln P_B)$$

$$= (c G_C^\circ + d G_D^\circ - a G_A^\circ - b G_B^\circ) + (c RT \ln P_C + d RT \ln P_D - a RT \ln P_A - b RT \ln P_B)$$

$$\Delta G = \Delta G^\circ + RT \ln \frac{P_C^c \times P_D^d}{P_A^a \times P_B^b} \quad \text{--- ①}$$

This is the vant' Hoff isothermal equation.

At equilibrium $\Delta G = 0$

$$\therefore \boxed{\Delta G^\circ = -RT \ln K_p}$$

6. A mixture of 2.0 moles of SO_2 and 3.0 mole of O_2 is placed in a 10 litre reacting vessel at 800K and at equilibrium 0.6 mole of SO_3 is formed. calculate the total pressure of the reaction mixture and K_p . $2\text{K}+2$.

At initial state. 2 1 0 mole

At equilibrium $2-2x$ $1-x$ $2x$ mole.

According to the question. $2x = 0.6$

$$x = 0.3 \text{ mole}$$

$$T = 800\text{K}$$

$$V = 10 \text{ litre.}$$

$$\text{Now, } K_c = \frac{\left(\frac{2x}{V}\right)^2}{\left(\frac{2-2x}{V}\right)^2 \times \frac{1-x}{V}} = \frac{4x^2/V^2}{4(1-x)^2/V^2 \times (1-x)/V} = \frac{V^2 x^2}{(1-x)^3}$$

$$\therefore K_c = \frac{(20)^2 \times 3^2}{(1-0.3)^3} = 26.24$$

We know, $K_p = K_c (RT)^{\Delta n}$

$$= 26.24 \times (0.0821 \times 800)^{-1}$$

$$= 0.04$$

$$R = 0.0821 \text{ L atm K}^{-1} \text{ mol}^{-1}$$

$$\Delta n = 2 - 3 = -1$$

Again, $K_p = \frac{(3-x)x^2}{(1-x)^3 P} \Rightarrow P = \frac{(3-x)x^2}{K_p (1-x)^3}$

$$= \frac{(3-0.3) \times 0.04 \times 3^2}{0.04 \times (1-0.3)^3} = 17.71 \text{ atm}$$

At a certain temp. the equilibrium constant of a reaction is 0.21
 $N_2O_4 \rightleftharpoons 2NO_2$. calculate the partial pressure. The dissociation of N_2O_4 is 35%. at 298 K

Soln

Initial condition 1 mole

At equilibrium $1 - 2\alpha$ 2α mole

$$\text{Total mole} = 1 - 2\alpha + 2\alpha = 1 \text{ mole}$$

Now,

$$K_p = \frac{P_{NO_2}^2}{P_{N_2O_4}} = \frac{4\alpha^2}{1^2} \cdot P$$

$$\alpha = 0.35$$

$$K_p = 0.21$$

$$\Rightarrow P = \frac{K_p}{4\alpha^2} = \frac{0.21}{4 \times (0.35)^2} = 0.42 \text{ atm}$$

Ans

Q. The value of K_p at 298 K for the reaction $\frac{1}{2}N_2 + \frac{3}{2}H_2 \rightleftharpoons NH_3$ is found to be 826. Partial pressure being measured in atmospheric unit. calculate ΔG° at 298 K.

Soln: we know,

$$\Delta G^\circ = -2.303 RT \log K_p$$

$$= -2.303 \times 0.0821 \times 298 \times \log \frac{826}{1.987}$$

$$= -3977.78 \text{ cal}$$

Ans

Here,

$$T = 298 \text{ K}$$

$$K_p = 826$$

~~$R = 8.314 \text{ L atm}$~~

~~$R = 0.0821 \text{ L atm}^{-1} \text{ mol}^{-1} \text{ K}^{-1}$~~

$$\Delta G^\circ = ?$$

$$R = 1.987 \text{ cal mol}^{-1} \text{ K}^{-1}$$

Formation enthalpy of 1 mole NH_3 is $\frac{\Delta H}{2}$
Because Because $N_2 + 3H_2 \rightleftharpoons 2NH_3$

$$\Delta G^\circ \text{ গণনা করা যাবে } R = 1.99$$

$$\Delta G^\circ \text{ গণনা করা যাবে } R = 8.314$$

TAREK

Q) If the equilibrium constant K_p for the reaction $C_2H_2(g) + H_2(g) \rightleftharpoons C_2H_4(g)$ is 5.04 atm^2 at 25°C . calculate ΔG° .

Soln:

We know,

$$\Delta G^\circ = -2.303 RT \ln K_p$$

$$= -2.303 \times 8.314 \times 298 \times \ln(5.04 \times 10^2)$$

$$= -200 \text{ kJ}$$

Ans

Here,

$$K_p = 5.04 \text{ atm}^2$$

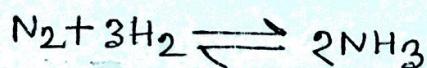

$$T = 298 \text{ K}$$

$$\Delta G^\circ = ?$$

$$R = 8.314 \text{ J K}^{-1} \text{ mol}^{-1}$$

Q) At 500°C the reaction between N_2 and H_2 to form ammonia has $K_c = 6 \times 10^2$. What is the numerical value of K_p for the reaction.

Soln: The equilibrium reaction is

We know,

$$K_p = K_c (RT)^{\Delta n}$$

$$= 6 \times 10^2 \times (0.0821 \times 773)^{-2}$$

$$= 1.5 \times 10^{-5}$$

Ans

Here,

$$T = 500^\circ\text{C} = 773 \text{ K}$$

$$K_c = 6 \times 10^2$$

$$\Delta n = 2 - (1+3) \\ = -2$$

$$R = 0.0821 \text{ Latm K}^{-1} \text{ mole}^{-1}$$

Q) In a reversible reaction the value of Δn is $\frac{1}{2}$. At what temp. the value of K_p and K_c will be 40.5 and 5.5. $R = 0.0821 \text{ Latm K}^{-1} \text{ mole}^{-1}$

Soln: We know,

$$K_p = K_c (RT)^{\Delta n}$$

$$\Rightarrow \frac{40.5}{5.5} = (0.0821 \times T)^{1/2}$$

$$\Rightarrow T = \frac{1}{0.0821} \times \left(\frac{40.5}{5.5}\right)^2$$

$$T = 661.22 \text{ K}$$

Ans

$$\Delta n = \frac{1}{2}$$

$$K_p = 40.5$$

$$K_c = 5.5$$

$$R = 0.0821 \text{ Latm K}^{-1} \text{ mole}^{-1}$$

• Write the equilibrium constant expression for the reaction

Sol:- The equation is already balanced. The numerical quotient H_2 and NH_3 are 3 and 2 respectively. The concentration of the product is $[NH_3]^2$ and partial pressure is $P_{NH_3}^2$. The product of the concentration of the reactant is $[N_2][H_2]^3$. The product of the partial pressure of the reactants is $P_{N_2} \times P_{H_2}^3$.

$$\text{So, } K_c = \frac{[NH_3]^2}{[N_2][H_2]^3}$$

$$\text{and, } K_p = \frac{P_{NH_3}^2}{P_{N_2} \times P_{H_2}^3}$$

13. With the help of law of mass action calculate the values of K_p and K_c for the reaction. $P_{Cl_5} = P_{Cl_3} + Cl_2$

Sol:- Let us consider the reaction is performed in pressure P , and volume V . Let, and the degree of dissociation is x .

At initial state
mole number

1 0 0 mole

At ~~final~~ ^{equilibrium} state
mole number

$1-x$ $1-x$ $1-x$ mole

At equilibrium state the molar concentration of the ~~molecules~~ elements

$$[PCl_5] = \frac{1-x}{V} \text{ mol/L} \quad [PCl_3] = \frac{x}{V} \text{ mol/L} \quad [Cl_2] = \frac{x}{V} \text{ mol/L}$$

$$\therefore K_c = \frac{[PCl_3] \times [Cl_2]}{[PCl_5]} = \frac{\frac{x}{V} \times \frac{x}{V}}{\frac{1-x}{V}} = \frac{x^2}{(1-x)V}$$

$$K_c = \frac{x^2}{(1-x)V}$$

[KP] Let at equilibrium the total mole number α
 $= 1-\alpha + \alpha + \alpha = 1+\alpha$

$$\therefore P_{Pcl_5} = \frac{1-\alpha}{1+\alpha} p_{atm}, P_{Pcl_3} = \frac{\alpha}{1+\alpha} p_{atm}, P_{Cl_2} = \frac{\alpha}{1+\alpha} p_{atm}$$

$$\therefore K_p = \frac{P_{Pcl_3} \times P_{Cl_2}}{P_{Pcl_5}} = \frac{\frac{\alpha}{1+\alpha} p \times \frac{\alpha}{1+\alpha} p}{\frac{1-\alpha}{1+\alpha} p} = \frac{\alpha^2 p^2}{(1+\alpha)^2} \times \frac{1+\alpha}{1-\alpha} p = \frac{\alpha^2}{1-\alpha^2} p$$

$$\boxed{K_p = \frac{\alpha^2}{1-\alpha^2} p}$$

34. With the help of the law of mass action calculate the value of K_p and K_c from the reaction: $H_2 + I_2 \rightleftharpoons 2HI$

Soln:- Let us consider the reaction is performed at pressure p atm.
 volume V litre and degree of dissociation is α

At initial state mole number	a	b	α mole
---------------------------------	-----	-----	---------------

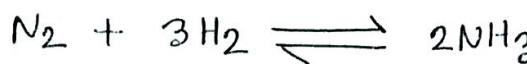

At equilibrium mole number	$a-\alpha$	$b-\alpha$	2α mole
-------------------------------	------------	------------	----------------

$$\therefore K_c = \frac{4\alpha^2}{(a-\alpha)(b-\alpha)}$$

$$K_p = \frac{4\alpha^2}{(a-\alpha)(b-\alpha)}$$

35. with the help of the law of mass action calculate the value of K_p and K_c for the equilibrium: $N_2 + 3H_2 \rightleftharpoons 2NH_3$

Soln:
 According to ③

At initial state mole number	a	b	α mole
---------------------------------	-----	-----	---------------

At equilibrium state mole number	$a-\alpha$	$b-3\alpha$	2α mole
-------------------------------------	------------	-------------	----------------

$$K_p = \frac{4\alpha^2(a+b-2\alpha)^2}{(a-\alpha)(b-3\alpha)^3}$$

$$K_p = \frac{16\alpha^2(2\alpha)^2}{27p^2(3-\alpha)^4}$$

$$K_c = \frac{4\alpha^2 V^2}{(a-\alpha)(b-3\alpha)^3}$$
